Show Me God: What the Message from Space is Telling Us about God Fred Heeren

Recent scientific discoveries have raised questions that science can't answer. In this book, author Fred Heeren tells why even Einstein had to revise his thinking to bring it in line with the Bible's claims. Through Heeren's interviews with Steven Hawking and Nobel prize-winning physicists, you'll learn why many leading cosmologists today are bringing God into the equation.

Show Me God: What the Message from Space is Telling Us about God Details

Date : Published January 1st 1996 by Daystar Productions

ISBN : 9781885849519

Author : Fred Heeren

Format : Hardcover 336 pages

Genre : Science, Nonfiction, Religion, Christianity, Spirituality, Theology

Brian says

Some very good nuggets in this work...other parts were a little weak

Lydel says

Incredible look through scientific, yet
spiritual eyes of our glorious world.

Allison Kohn says

This is one of my favorite book of all time favorite books. Fred is a good science writer and an interesting character, so he makes interesting information even more interesting. He also writes some good articles and i live for his info reports.

Rachel Lloyd says

This was one of my college textbooks for an honors class. Very enlightening!

Robyn says

It's been awhile since I've read this one, I'll have to read it again soon to write a better review.

Karen L. says

Hareen interviews both Christian and secular scientists with much candor. Full of information about the different theories for creation: Includes young earth and old earth. I have used this as a reference book often.

Alaa Nassef says

The books is great. The drawbacks of the book IMHO are the breaks the author put there as dialogues between himself and his imaginary editor Carl. To me those were one of the reasons I didn't give the book a five star rating.

Darrin Niday says

very interesting stuff in here

Neil says

I enjoyed this book. It took me a bit longer to finish it for two reasons: I misplaced it after packing to return home from vacation, and I wanted to savor it. The author discusses his interviews with various scientists as well as looking at various scientific 'questions and answers' and how they may relate to Scripture. I found it to be a fascinating book. Most of the stuff he discusses revolves around cosmology specifically and not so much the other 'Earth Sciences', so perhaps in his other volumes he will discuss them. I thought the book was well-written, and it held my interest throughout most of the book.

I think the 'most annoying' part[s] of the book involved the author having a fake conversation with another person. I realize they were meant as humorous breaks in the book, but they did get annoying. Perhaps others found them funny; some of them were mildly amusing. Overall, though, I did not feel as if these 'attempted humor segments' took away from the message behind the book.

I did find his last chapter [before the bonus sections] to be of interesting. He discussed Biblical heroes who started off as skeptics and how important it is to ask questions. He did make a great point how God would provide some sort of answer/response to those asking the questions whereas in today's world some leaders would want to call down fire-and-brimstone on people asking questions.

I think one of the saddest lines in the book is how one scientist freely admits if he were a religious person he would have no choice but to admit there is a God Who created the universe for us [mankind] to enjoy, but since he is not religious he prefers to perceive the universe in a different fashion.

I also liked the chapter that talked about fifty scientists who were [are] Christians and what they studied. I knew there were many who did believe, and he admits he did not list all of them.

I think this book would go a long way to helping a Christian who had questions but was unsure of how to get answers. I also think it could be helpful for somebody who has questions who is not a Christian/believer. I also realize that there are compelling arguments either way for people. I could see using it for a reference for further study.

Overall, I enjoyed the book.

Anthony Edridge says

Fred Heeren provides a fascinating look at science, much of it astronomy. His unique insight and thought provoking questions lead the reader into a comfortable perspective that our universe is no accident. Personally, he interviewed a dozen eminent scientists and incorporated their discussions, often light hearted and humorous.

This is an excellent book for a first time foray into the science of this universe and the intelligence that designed it.

Luis says

For the nonbeliever in your life!

Miriam Ruth says

This book changed my perspective of the world when I was about 13-14 years old. I went from questioning the existence of a higher being to having a reasonable basis for accepting the possibility that there is indeed an intelligent force greater than limited, blind mortals. There has to be a higher explanation for the fact there is time and space and matter ... I am not blind enough to think they magically appeared. There is something behind the "magic" that atheism claims. This book keep the question of a higher existence open. There is not enough evidence to the contrary. It is ridiculous to think a Rolex or Apple computer could trip into existence ... and these are infinitely less complex than our universe. I just cannot comprehend how a person could be convinced that infinitely more complex designs are chance happenings while less complex designs (i.e. Apple software) are not. It goes beyond my comprehension how such arguments could seem remotely intelligent. This book will show you how ridiculous it is to think that we randomly appeared here minus intelligent design. It also leaves the question open on how the earth was created it. An intelligent mind could have orchestrated the big bang and even evolution ... these theories are certainly NOT EVIDENCE FOR NOT HAVING A HIGHER INTELLIGENCE IN THE UNIVERSE. We need to look at science to better comprehend our universe, and this book is a great start. That being said, I consider myself agnostic and see a separation between believing in higher intelligence who orchestrated the design of the universe and a religious entity wanting to control our lives. Any atheist who wants to debate otherwise (i.e. that there is no intelligence in the universe), better read this book in addition to every other science book before forming an opinion. I am tired of hearing religious creationist ideas (which try to take an unscientific stab at how things were created) in addition to atheist anti-creationist ideas (which try to say magical chance brought it together). Both are unscientific and ignorant. Only science can show us the ultimate truth while we do not have access to other dimensions.

Greg Ressler says

Faked and/or flawed evidence, arguments that have already been dismantled/disproven. Nothing new, but a nice attempt.

Rebecca (whenallotherlightsgout) says

So glad I only had to read a portion of this for school. It was kinda confusing, but that could be because I find space too abstract to wrap my mind around.
